

Phase 6 - Project Testing Phase

The testing phase verifies that FitBuddy functions correctly from user input through AI generation, database storage, feedback updates, and local deployment.

Functional Testing

- Test user form submission.
- Test input validation.
- Test 7-day workout-plan generation.
- Test nutrition/recovery tip generation.
- Test feedback-based plan updating.

Database Testing

- Verify that user information is stored correctly.
- Verify that original plans are stored.
- Verify that updated plans are stored separately.
- Verify that the admin page can retrieve stored records.

Interface Testing

- Check the homepage and input fields.
- Check result.html for workout and nutrition output.
- Check feedback form submission.
- Check the admin user and plan display.
- Verify responsive and readable page layouts.

Deployment Verification

- Start the application using Uvicorn.
- Open <http://127.0.0.1:8000> in a browser.
- Open <http://127.0.0.1:8000/docs> to test the FastAPI API documentation.
- Verify that the complete frontend, backend, AI, and database workflow operates together.
